Bloom filters

Overview

- 1 Finding things
- 2 Hashes
 - What is a hash
 - Load
 - Collisions
 - Using them in code
- 3 Bloom filters

Hashes
What is a hash
Load
Collisions

Bloom filters

Already seen binary search faster than linear.

- But binary search only works on ordered sequences.
 - Sorted list/array, Binary Search Trees (BSTs) etc.
- $O(\log n)$ vs. O(n).
- What's better than O(n)?

Hashes

- But binary search only works on ordered sequences.
 - Sorted list/array, BSTs etc.
- $O(\log n)$ vs. O(n).
- What's better than O(n)?
 - *O*(1).

Can we lookup values in O(1) time?

Unordered sequence

Finding things

Hashes

Load

Collisions

Using them in code

Bloom filters

Want to store information on all UK motorways.

49 motorways.

Option 1.

- Unordered sequence.
- List/array/vector.
- Finding specific motorway is O(n).
- \blacksquare Space required, O(n).

Pos	Motorways	
0	M9	
1	M55	
2	M898	
3	M4	
4	M1	
5	M6	
•

Lookup table

Finding things

Hashes
What is a hash
Load
Collisions
Using them in coc

Bloom filters

Option 3

- Lookup table.
- Each motorway stored in position corresponding to it's number.
 - E.g. M1 in position 1, M53 in position 53.
- Finding specific motorway is O(1).
 - Very fast.
- Space required, O(max(n)), 899 spaces.
 - Very inefficient...

Lookup table

Finding things

Hashes

Hash table

Finding things

Hashes
What is a hash
Load
Collisions

Bloom filters

Option 4

- Hash table.
- Pass each motorway through a hash function.
- Store hashes in lookup table.
- Finding specific motorway is O(1) ish.
- Space required, O(n).

Hashes

Bloom filters

Hash tables.

Unordered associative arrays.

- Unordered we have no control over the item orders.
- Associative Lookup a value based on a key.
 - I.e. Python dict(), C++ map<>.
- Fast.
 - O(1) lookup (potentially).
 - $O(1) \leq \text{Reality} \leq O(n)$.

Hashes
What is a hash
Load

Collisions

Bloom filters

Hash is just a number.

- Based on some other value.
- Motorway example hash could just be the M-number.
 - I.e. M898 → 898.

What if key is not an int?

- Hash function.
- Converts an input of any size/range to a fixed size/range.
- Related to, but distinct from:
 - Checksums.
 - Fingerprints.
 - Parity codes.

What is hash? II

Finding things

Hashes

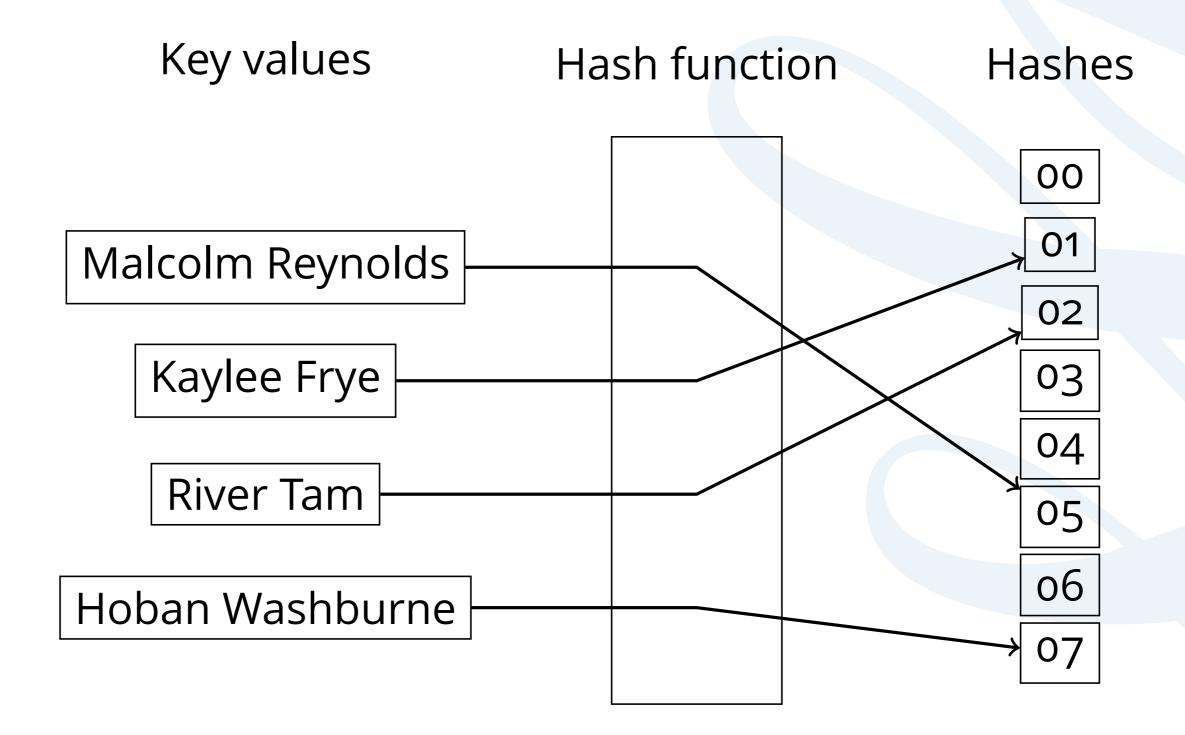

What is a hash

Load

Collicions

Using them in code

Bloom filters

Hashes

Finding things

Hashes

What is a hash

Luau

Collisions

Bloom filters

Signs of a good hash table hashing algorithms.

- Computationally lightweight.
- Evenly distributed hashes.
 - E.g. len() would be terrible hash function, loads of different inputs produce same value.

Input	CRC32 hash
"Small text."	3840495446
1	3523407757
[1,2,3,4,5]	1191942644
"On the Origin of Species" 158,454 words	3877468994
	192271774

Hash function

Finding things

Hashes

What is a hash

Collisions

Using them in code

Bloom filters

So how does a hash function work?

- Depends on hash function and purpose.
- Not going to be implementing any real algorithms.
 - Optimized to be very fast, not understandable.
 - Generally full of binary representations.
 - Bit shifting.
- Simple hashing algorithm (division method).
 - Break the thing being hashed into blocks.
 - 1, 2, 4, 8, 16 bytes in size.
 - 2 Add up all the blocks.
 - Modulo by a prime number.

Cryptographic hashses.

Finding things

Hashes

What is a hash

C - 111 - 1 - - -

Using them in code

Bloom filters

Side note, different hashes for different purposes.

- Hash table hashes.
 - Computationally lightweight as possible.
- Cryptographic hashes.
 - lacksquare Computationally lightweight-ish to go key ightarrow hash.
 - \blacksquare Computationally expensive to go hash \rightarrow key.
 - MD (Message-Digest algorithm)
 - Famously MD5, widely used, no longer secure.
 - MD6 still good.
 - SHA (Secure Hash Algorithm)
 - SHA-o, SHA-1 not secure.
 - SHA-2, SHA-3 still good.

Finding things

Hashes
What is a hash
Load
Collisions
Using them in coo

Bloom filters

- Hashed "buckeroo" with CRC32.
 - CRC32 **NOT** best choice for hash table but is easy and widespread.
 - Hash of 1306201125

Finding things

Hashes
What is a hash
Load
Collisions
Using them in coo

Bloom filters

- Hashed "buckeroo" with CRC32.
 - CRC32 **NOT** best choice for hash table but is easy and widespread.
 - Hash of 1306201125
- So our hash table needs at least 1,306,201,125 slots.
 - 4 bytes per integer * 1306201125 slots = 5.2 gigabytes.
 - Not going to work.

Load
Collisions
Using them in coo

Bloom filters

- Hashed "buckeroo" with CRC32.
 - CRC32 **NOT** best choice for hash table but is easy and widespread.
 - Hash of 1306201125
- So our hash table needs at least 1,306,201,125 slots.
 - 4 bytes per integer * 1306201125 slots = 5.2 gigabytes.
 - Not going to work.
- Solution? Take the modulo of the hash.
 - Create table of small size.
 - slot = hash % len(hashtable)

Collisions

Finding things

Hashes

What is a hash
Load

Using them in cod

Bloom filters

Converting big sequences into short hashes.

Any downsides?

Hashes
What is a hash
Load
Collisions
Using them in coo

Bloom filters

Converting big sequences into short hashes.

- Any downsides?
- Some distinct sequences **MUST** produce same hash.
- Hash collision.
- I.e. Hashing an int
 - int has 4 billion possible values.
 - If hash is one byte, then 256 possible slots.
 - 4 billion possible values in 256 possible slots, collisions will happen.
- E.g. CRC32 hash.
 - "plumless" \rightarrow 1306201125 \leftarrow "buckeroo"

Table size

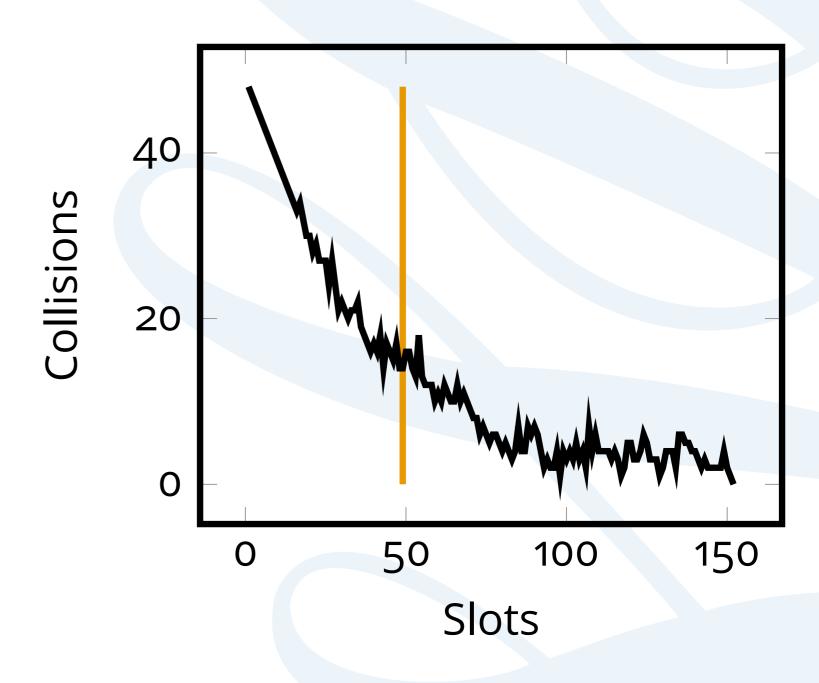

Finding things

Hashes
What is a hash
Load
Collisions
Using them in coo

Bloom filters

Bigger the hash table == less collisions.

- Ideal motorway hash table.
 - 49 motorways.
 - 49 slots.
 - o collisions.
- Reality.
 - 49 slots.
 - 14 collisions.
 - I.e. M18, M67 and M606 in slot18.

- Optimal.
 - 152 slots.
 - o collisions.
 - Size only 3.1 times ideal.

Hashes

what is a has

Collisions

Using them in code

Bloom filters

Number of collisions depends on load factor (/).

- Ratio of elements (n) to available slots (k).
 - $I = \frac{n}{k}$
- High load = lots of collisions (probably).
- Low load = few collisions (probably).
- I > 1.0 = definitely some collisions.

Hashes

Bloom filters

Number of collisions depends on load factor (/).

- Ratio of elements (n) to available slots (k).
 - $I = \frac{n}{k}$
- High load = lots of collisions (probably).
- Low load = few collisions (probably).
- I > 1.0 = definitely some collisions.
- Previous motorway example.
 - 49 motorways, 49 slots, *l* = 1
 - 49 motorways, 152 slots, l = 0.31

Adjusting for load

Finding things

Hashes
What is a hash
Load
Collisions
Using them in cod

Bloom filters

Real world hash tables.

- Automatically resize to provide more slots as load increases.
- Advantages
 - Table size adjusts for the amount of elements stored in it.
 - Minimal wasted memory.
- Disadvantages
 - Have to shuffle everything around when the table resizes.
 - Not all that time consuming.

Handle collisions

Finding things

Hashes

Load

Bloom filters

So what do we do when we have collisions?

- If have \geq 1 elements then collisions are possible.
 - Regardless of table size.
- Two main approaches

Separate chaining.

- Each slot is a linked list.
- Infinitely resizeable.
- Add new item to end of the list.

Open addressing.

- Slot is already full?
- Try next slot until an empty one is found.

Handle collisions II
