Recap

A series of objects all of the same size and type.

- Stored in contiguous blocks of memory.
- Python lists are functionally closest.
  - But are not arrays.
- Can't be resized.

#### Linked lists

The challenger for array's crown.

- Series of nodes, each of which points to the next element.
  - And to the previous element if it's a doubly linked list.

Doubly linked 
$$\leftarrow$$
 A  $\rightarrow$  B  $\rightarrow$  C  $\rightarrow$  D

$$\mid \mathsf{A} \mid \overset{
ightarrow}{\leftarrow}$$

$$\mathsf{B} \mid \overset{\rightarrow}{\leftarrow}$$

### Not in contiguous memory.

- Each node is separate.
- Scattered.
- C++ Dynamic memory (pointers!).
  - Discussed in depth later in module.

- Why would we use linked lists instead of arrays?
  - Can change size.
  - Can quickly insert and delete elements.

```
class Node:
   __prev = None
   __next = None
   value = None
```

Linked lists II

```
class Node
{
private:
    Node *prev;
    Node *next;

public:
    int value;
};

## Removing array elements

temp = ['A', 'B', 'C', 'D', 'E']
array<char,5> temp {'A', 'B', 'C', 'D', 'E'};

- Array in memory, multiple elements in a contiguous block.
- How do we remove elements from the middle?
  - **1** Remove element from the array.
  - Move next element to occupy the empty space.
  - Repeat.
- Is very slow with large arrays.

### Removing linked list elements

- Linked list, separate elements scattered in memory.
- Each pointing to the next/prev element.
- How do we remove elements?
  - Change pointers.
  - Delete old element.

Recap

### Advantages

- Inserting and deleting elements is very fast.
  - O(1).
- No size limits, can keep adding new elements.
- Doesn't waste memory.

### Disadvantages

- Not indexed.
  - Can't ask for the 20<sup>th</sup> element etc.
  - Have to step through the list (slow).
- Needs more memory than an array to store the same number of elements.
  - Have to keep track of where the next/prev nodes are.

Recap

Arrays and linked lists are data structures.

- A specific way of storing data.
- Can see how the various elements of the structure are laid out in memory.
- Direct access to the underlying memory.

As we move to storing more complex information in our software we well start to encounter Abstract Data Types (ADTs).

- Software engineering principal.
- Keep what a data type can do... ...and how it does it separate.
- Unlike data structure ADTs only concerned with the interface.
- Internals of ADTs can vary widely between implementations.

Recap

### Imagine an ADT like a car.

- It has a set of supported operations, go faster, go slower, turn left, turn right.
- Don't care how it achieves these.
- Don't care if, internally, it's using a combustion engine or an electric motor.
- Only care about the result.
- Keep people away from the internal workings/data.

### A First In First Out (FIFO) ADT.

- Ends of the queue called the front and back.
- New elements added to back of queue only.
  - Pushing push(value)
- Old elements removed from front of queue only.
  - Popping pop()
- No cutting in.
- Buffer to hold items for processing in the order in which they arrive.
- Which would be better for a queue? An array or a linked list?
  - Linked list.

### A First In Last Out (FILO) ADT.

- Ends of the stack are called the top and bottom.
- New elements add to top of stack only.
  - Pushing push(value)
- Old elements removed from top of stack only.
  - Popping pop()
- No cutting in.
- Which would be better for a stack? An array or a linked list?
  - Doesn't matter performance wise.
  - Linked list if *n* is unknown.

### An unordered ADT.

- Items ordered by the set.
- You have no control over it.
- Sets contain unique elements.
  - Can't contain duplicates.
- Can add items to a set.
- Can remove items from a set.
- Can see if an item is in a set.
- $\blacksquare$  Can't get the  $n^{th}$  element.
  - It's unordered remember.

### Everyone

- Need to understand the structures before we can pick the right one.
- Different data structures have very different characteristics.
- Huge effect on efficiency of your code.
- If you pick the right ADT it can save you a lot of code.
  - E.g. why write code to check for duplicates? Use a set and they can't exist.
  - **E**.g. why write code to find the most recent addition to a list, use a stack.
